Report for MovEye

Initially, I made storage and model for a csv-file and for listView in MainWindow (correspondingly). After that I'd tried to realise some connection between them and make listView represent my data. Then, I'd created the InfoWindow, my second (pop-out) window. I had an index of a title of the movie the user'd chosen. That is how I'd connected QStringList with extended data about the movie and initial QMap with my whole data. I'd used the value of the key to connect these two objects. Also I wrote the code for adding movie to Watch List bud I did not connect it for working in the app.
